West Godavari District

Andhra Pradesh, India

Development of Bioenzymes

Bioenzymes are biological catalysts that are produced by living organisms. They are used in a variety of applications, including food processing, wastewater treatment, and bioremediation.

A workshop is organised for both rural folk and faculty of SRKREC for the effective use of Bioenzymes in daily routine. In this workshop, Sailendranadh explained that how to prepare Bioenzymes like home cleansers, water purification liquids, hand wash etc. Target beneficiaries are the women of Self help Groups (SHG's).

Plastic pollution is a major environmental problem in India. It can harm wildlife, pollute waterways, and contribute to climate change. Plastic pollution can also have a negative impact on human health. For example, plastic can leach harmful chemicals into the food chain.

There are a number of factors that contribute to plastic pollution in India. One factor is the rapid growth of the Indian economy. As the economy grows, so does the demand for plastic products. Another factor is the lack of awareness about the environmental impact of plastic pollution. Many people in India are not aware of the harm that plastic can cause.

There are a number of things that can be done to address plastic pollution in India. One important step is to increase awareness about the environmental

impact of plastic pollution. This can be done through education campaigns and public awareness initiatives. Plastic pollution is a serious problem in India, but it is a problem that can be solved. By working together, we can create a cleaner and healthier India for future generations.

Awareness campaigns on single use plastic were conducted in China Amiram, Peda Amiram and Gollalakoderu villages. Students of SRKREC explained the need to shift from plastic to biodegradable goods. These type of activities will help to reduce plastic pollution in rural India and create a cleaner and healthier environment for future generations.

Dengue is a mosquito-borne illness that is caused by the dengue virus. Dengue is a serious illness that can cause fever, headache, muscle pain, rash, and bleeding. In severe cases, dengue can be fatal. There is no specific treatment for dengue.

So, awareness is essentially needed among the rural public where the problem is very serious. With this

motto, a program is initiated to raise the awareness on dengue fevers and precautions to be taken to avoid. Large group of students went to various villages adopted by UBA and organised campaigns.

Saplings are important because they can help to improve the environment in a number of ways. Saplings are an important part of the environment and can help to improve air quality, reduce noise pollution, provide shade, attract wildlife, and increase property value. During special days, Gandhi Jayanthi etc., UBA cell is initiating sapling of plants in villages and encourage the students at their locations.

Children are the future of our world. They are the ones who will inherit our planet and our society. It is important to invest in children and their education so that they can grow up to be healthy, happy, and productive members of society. We all have a role to play in ensuring that children have the best possible future. But now a day's majority of the children are subjected to Abusement at home, schools and in public

places. Child abuse is not just physical violence directed at a child. It is any form of maltreatment by an adult, which is violent or threatening for the child.

UBA in association with Women Empowerment Cell took initiation to make the children aware of such Abusement practices. If they notice any of such practices, they should immediately report the same to responsible persons, told the members to children. They also guided the school teachers to form a monitoring committee at school level.

Mega Medical camps:

Mega medical camps represent a pivotal means of delivering essential healthcare services to communities facing challenges in accessing quality medical assistance. These comprehensive initiatives not only contribute to enhancing the overall health and well-being of individuals and families but also play a crucial role in alleviating the strain on local hospitals and clinics. Collaborating with Rastriya Netra Yagna, the UBA Cell orchestrated a commendable effort by organizing a free medical campaign dedicated to serving the public in the adopted villages. This noble endeavor aimed to address the healthcare needs of the community, providing essential medical services, consultations, and screenings to those who might otherwise face barriers in obtaining adequate healthcare. By fostering such collaborative and community-focused initiatives, the UBA Cell not only contributes to immediate health improvements but also promotes the broader goals of public health and well-being in the adopted regions. Such endeavors underscore the importance of collective efforts in ensuring that healthcare services reach the underserved and contribute to building healthier and more resilient communities.

Handwash Promotion Programs

Personal hygiene constitutes the conscientious practice of ensuring one's body remains clean and devoid of harmful germs. This fundamental habit plays a pivotal role in safeguarding overall health and serves as a crucial measure in thwarting the transmission of diseases. A key aspect of personal hygiene promotion lies in advocating for regular handwashing with soap and water-a simple yet powerful public health intervention. Encouraging individuals to adopt this practice can significantly contribute to disease prevention and community well-being.

Handwashing promotion stands out as an effective strategy to enhance public health outcomes. Numerous studies substantiate the profound impact of regular handwashing on reducing the risk of various illnesses. For instance, research has demonstrated that consistent handwashing can decrease the likelihood of contracting diarrhea by as much as 50%, and respiratory infections by up to 25%. This underscores the significance of hand hygiene not only as a personal health practice but as a collective effort to mitigate the spread of infections within communities. By emphasizing the importance of handwashing, public health campaigns and interventions can empower individuals to take proactive measures in protecting themselves and others. This, in turn, contributes to the creation of healthier and more resilient communities by minimizing the incidence of preventable illnesses and fostering a culture of hygiene-

conscious behavior. As an integral component of personal hygiene, handwashing promotion exemplifies a straightforward yet impactful strategy with far-reaching implications for public health.

Before the imposition of the Covid-19 lockdown in India, the UBA Cell of SRKREC took proactive measures to address public health concerns, particularly focusing on promoting personal hygiene with an emphasis on handwashing. Recognizing the critical role of hygiene practices in disease prevention, the UBA Cell initiated immediate efforts to educate and instill awareness, particularly targeting the rural population and school children.

The first phase of these initiatives involved the UBA team concentrating on schools, aiming to educate students across different levels, including Primary and Upper Primary. Dr. G. Suribabu, Dr. P. Raghuram, and Dr. T. Rambabu played instrumental roles in narrating and demonstrating proper handwashing techniques. Their efforts were geared towards not only instructing the students on the importance of hand hygiene but also actively involving them in adopting these practices as part of their daily routine.

As part of their outreach, the UBA team went beyond education and distributed essential supplies to facilitate hand hygiene. This included the distribution of handwash liquids and sanitizers on behalf of UBA,

ensuring that the students and the wider community had access to the necessary tools for maintaining personal hygiene standards. This multifaceted approach not only raised awareness but also provided tangible resources to support the implementation of recommended hygiene practices.

The proactive stance taken by the UBA Cell reflects a commitment to community well-being and underscores the importance of grassroots initiatives in the face of public health challenges. By targeting schools and the broader rural population, the UBA team played a vital role in creating a foundation for sustained personal hygiene practices, contributing to the overall health and safety of the community amid the Covid-19 pandemic.
